

The finest selector tape produced

No OTHER TAPE MANUFACTURER COMES CLOSE

Decades of fine-tuning have yielded one of the most sophisticated, most closely controlled manufacturing processes you're likely to find anywhere: the Adams selector tape process.

AAA-grade blue polished spring steel is combined with production methods that guarantee accuracy of intervals between each and every perforation.

All Adams tape is "mill certified" for metallurgical quality. Then it's stamped on a special "straight side" stamping press which is capable of producing tape to exacting specifications.

Adams'-designed "one of a kind" optical monitoring device inspects all new tape as it leaves the press. Any deviation from perforation centers of $1.000" \pm 0.0002"$ over 27 perforations is rejected. This is important because this is the riding distance over the sheave where accuracy is critical.

ARW300 selector tape replaces Armor part no. U5-4415-1 tape (10978-02). Mechanics who have installed our tape once insist on it for every job. Cab levelling and selector adjustments are easier when the selector tape being installed is manufactured to such tight tolerances.

ARW300. Selector tape. Order by the foot.

Quality machinery, optical monitoring, superior tooling, and skillful set-up ensure that all ARW300 selector tape perforations are centered precisely on 1.000" centers
